

RaceDay Event Management System - Entity Relationship Diagram

Model answer / marking memorandum. The design contains seven entities and resolves the Participant-to-Event many-to-many relationship through Enrolment.

Relationship	Cardinality / marking interpretation
User - Organiser	One User may have one Organiser profile; each Organiser profile belongs to exactly one User.
User - Participant	One User may have one Participant profile; each Participant profile belongs to exactly one User.
Organiser - Event	One Organiser can create many Events; each Event is owned by one Organiser.
Event - Category	One Event has one or more Categories; each Category belongs to one Event.
Participant - Event	Many-to-many conceptually; resolved by Enrolment. A Participant can enter many Events and an Event can have many Participants.
Category - Enrolment	Each Enrolment selects one Category. The SQL uses a composite FK so the Category must belong to the selected Event.
Enrolment - Result	An Enrolment may have zero or one Result; a Result belongs to exactly one Enrolment.
